22 Testing the Solution
Data transiting between clients (e.g. PCs, tablets, phones, etc.) and servers is predominantly encrypted with Secure Socket Layer (SSL) or the newer Transport Layer Security (TLS) (ref. Google Transparency Report). Pervasive encryption results in threats being hidden and invisible to security inspection unless traffic is decrypted. This creates serious risks, leaving organizations vulnerable to costly data breaches and loss of intellectual property.

An integrated F5® BIG-IP SSL Orchestrator® and Trellix Data Loss Prevention (DLP) (formerly McAfee DLP) solution solves this SSL/TLS challenge across cloud, mobile, and on-premises environments. BIG-IP SSL Orchestrator centralizes SSL/TLS inspection throughout the complex security architectures, providing high-performance decryption of web traffic for security services like Trellix DLP to detect and block data breaches hidden by encryption. This joint solution thus eliminates the blind spots introduced by SSL/TLS and closes any opportunity for attackers.

This guide provides recommended practices for structuring the BIG-IP SSL Orchestrator and Trellix DLP solution.

**Solution Overview**

BIG-IP SSL Orchestrator, deployed inline to the wire traffic, intercepts any outbound secure web request and establishes two separate SSL/TLS connections, one each with the client (the user device) and the requested web server. This creates a decryption zone between the client and the server for inspection.

Within the inspection zone, both unencrypted HTTP and decrypted HTTPS requests are encapsulated within Internet Content Adaptation Protocol (ICAP, RFC3507) and steered to the Trellix DLP systems for inspection and possible request modification (REQMOD). In this context, BIG-IP SSL Orchestrator is the ICAP client and Trellix DLP is the ICAP server. After inspection, user HTTPS requests are re-encrypted by BIG-IP SSL Orchestrator, on their way to the web server.

The same process of decryption, inspection, and re-encryption takes place for the return response from the web server to the client. See Figure 1.
DYNAMIC SERVICE CHAINING

A typical security stack often consists of multiple systems such as a DLP, next-generation firewall (NGFW), intrusion detection or prevention systems (IDSs/IPSs), and malware analysis tools. All these systems require access to decrypted data for inspection. BIG-IP SSL Orchestrator easily integrates with existing security architectures and centralizes SSL/TLS decryption across these multiple inspection devices in the security stack. This ‘decrypt once and steer to many security devices’ design addresses latency, complexity, and risk issues that can occur if decryption is performed on every single security device. Customers can also create multiple service chains for different traffic flows using the context engine.

Services in BIG-IP SSL Orchestrator

A service in BIG-IP SSL Orchestrator is defined as a pool of identical security devices. For example, a Trellix DLP ICAP service would include one or more Trellix DLP systems. BIG-IP SSL Orchestrator will automatically load balance the traffic to all the systems in a service.

Health monitoring

BIG-IP SSL Orchestrator provides various health monitors to check the health of the security devices in a service and handles failures instantly. For example, in a Trellix DLP ICAP service, should a system fail, BIG-IP SSL Orchestrator will shift the load to the active Trellix DLP systems. Should all the systems in the service fail, BIG-IP SSL Orchestrator will bypass the service to maintain network continuity and maximize uptime.
CONTEXT ENGINE FOR TRAFFIC CLASSIFICATION

BIG-IP SSL Orchestrator’s context engine provides the ability to intelligently steer traffic based on policy decisions made using classification criteria, URL category, IP reputation, and flow information. In addition to directing the traffic to service chains, customers can also use the context engine to bypass decryption to applications and websites like financials, government services, health care, and any others, for legal or privacy purposes.

HIGH AVAILABILITY

BIG-IP SSL Orchestrator supports an active-standby high availability (HA) architecture—one system actively processes traffic while the other remains in standby mode until needed. The goal is to decrease any downtime and eliminates single points of failure. Configuration and user connection information are synchronized automatically between the system.

LICENSE COMPONENTS

The BIG-IP SSL Orchestrator solution supports two licensing modes—standalone and LTM add-on.

Standalone model

The BIG-IP SSL Orchestrator product line—the i2800, r2800, i4800, r4800,i5800, r5800, i10800, r10800, r10900, i11800, i15800, and Virtual Edition High Performance (HP)—supports this joint solution. The F5® VIPRION® platform and the F5® VELOS® platform are also supported.

This option is suited for environments that need standalone security solutions and have no need to integrate with other F5 software functions. Standalone mode restricts the F5 platform to the following additional software modules:
- F5® BIG-IP® Access Policy Manager® (APM) to authenticate and manage user access.
- F5® BIG-IP® Advanced Firewall Manager® (AFM) to protect against denial-of-service.
- F5® BIG-IP® Advanced WAF® to protect against common vulnerabilities (CVEs) and web exploits, targeted attacks, and advanced threats.
- F5 Secure Web Gateway Services to filter and control outbound web traffic using a URL database or an F5 URL filtering (URLF) subscription to access the URL category database.
- An F5® IP Intelligence Services subscription for IP reputation service.

LTM add-on module
The high-end VIPRION platform, which can run multiple BIG-IP guest instances enabled by the F5 Virtual Clustered Multiprocessing™ (vCMP) technology, and the F5® BIG-IP® platform support the LTM add-on module.

This option is suited for environments that need to deploy BIG-IP SSL Orchestrator on an existing F5 device or have other functions that must run on the same device. There are no specific restrictions on additional F5 software modules. Optionally, customers can add the functionality of:

- An F5 URLF subscription.
- An F5® IP Intelligence Services subscription.
- A network hardware security module (HSM) to safeguard and manage digital keys for strong authentication.

Note: Unless otherwise noted, references to BIG-IP SSL Orchestrator and the BIG-IP system in this document (and some user interfaces) apply equally regardless of the F5 hardware used. The solution architecture and configuration are identical.

It is recommended to contact Trellix directly for information regarding DLP licensing options and a full understanding of the Trellix DLP product’s enforcement and reporting capabilities.
**ARCHITECTURE BEST PRACTICES**

Several best practices can help ensure a streamlined architecture that optimizes performance and reliability as well as security. F5 recommendations include:

- **Deploy inline.** Any SSL/TLS visibility solution must be in-line to the traffic flow to decrypt perfect forward secrecy (PFS) cipher suites such as elliptic curve Diffie-Hellman encryption (ECDHE).
- **Deploy BIG-IP SSL Orchestrator in a device sync/failover device group (S/FDG) that includes the HA pair with a floating IP address.**
- **Use dual homing.** Trellix DLP systems must be dual homed on the inward and outward VLANs with each F5 system in the device S/FDG.
- **Achieve further interface redundancy with the Link Aggregation Control Protocol (LACP).** LACP manages the connected physical interfaces as a single virtual interface (aggregate group) and detects any interface failures within the group.

**SECURITY BEST PRACTICES**

SSL/TLS orchestration generally presents a new paradigm in the typical network architecture. Previously, client/server traffic passed encrypted to inline security services, which then had to perform their own decryption if they needed to inspect that traffic. With an integrated BIG-IP SSL Orchestrator solution, all traffic to a security device is decrypted—including usernames, passwords, and social security and credit card numbers. It is therefore highly recommended that security services be isolated within a private, protected enclave defined by BIG-IP SSL Orchestrator. It is technically possible to configure BIG-IP SSL Orchestrator to send the decrypted traffic anywhere that it can route to, but this is a dangerous practice that should be avoided.

**Initial Setup**

Complete these initial steps before performing detailed configuration of BIG-IP SSL Orchestrator. In addition, refer to the Trellix DLP product guide and BIG-IP SSL Orchestrator setup knowledge base.
CREATE A DLP POLICY RULE

Log in to the Trellix ePolicy Orchestrator (ePO) system. Verify the DLP system is managed and licensed in the Trellix ePO system.

1. From the main menu, navigate to Data Protection > DLP Policy Manager.
2. On the DLP Policy Manager page, at the left bottom, click on the Actions drop down list. Choose the New Rule Set option.
3. Give a name for the rule set and click Next. This will create a new rule set. Next, add a rule to this rule set.
4. Click on the above created rule set. In the Actions drop down list, choose New Rule > Web Protection.
5. Give the rule a name. In the Classification section, choose the classification. Example below shows the US PII choice selected to flag PII data violations.

6. Click on the Reaction tab, select the Action, and choose the User Notification method. Example below shows the Block action and Default web protection user notification method selected to report an incident.
7. Click the Save button and then press Close.

9. In the Actions dropdown, choose Assign Rule Sets to a Policy. Select the policy and check the rule set that was created above, then click OK. The DLP systems that inherit the selected policy will enforce the assigned rule.

**CONFIGURE THE VLANS AND SELF-IPS ON THE BIG-IP SYSTEM**

For BIG-IP SSL Orchestrator deployment in a layer 3 (routed or explicit proxy) topology, the F5 system must be configured with appropriate client-facing, outbound-facing VLANS and self-IPs and routes. The VLANS define the connected interfaces, and the self-IPs define the respective IPv4 and/or IPv6 subnets. Refer to the F5 Routing Administration Guide for configuration steps to set up the VLANS and self-IPs.

**IMPORT A CA CERTIFICATE AND PRIVATE KEY INTO THE BIG-IP SYSTEM**

For BIG-IP SSL Orchestrator in an outbound traffic topology, a local CA certificate and private key are required to re-sign the remote server certificates for local (internal) clients. For BIG-IP SSL Orchestrator in an inbound traffic topology, remote clients terminate their SSL/TLS sessions at the F5 system, so it must possess the appropriate server certificates and private keys. Refer to the F5 support article on managing SSL/TLS certificates for BIG-IP systems to understand the procedure.
UPDATE THE BIG-IP SSL ORCHESTRATOR APPLICATION

Periodic updates are available for BIG-IP SSL Orchestrator. To download the latest update:

1. Visit downloads.f5.com. You will need your registered F5 credentials to log in.
2. Click Find a Download.
3. Scroll to the Security product family, select SSL Orchestrator, and click the link.
4. Select and download the latest version of the SSL Orchestrator .rpm file.
5. Read the appropriate Release Notes before attempting to use the file.
6. On the Main menu, navigate to SSL Orchestrator > Configuration and click on the Upgrade SSL Orchestrator icon in the upper right.
7. Click Choose File and navigate to the .rpm file you downloaded. Select it and click Open.
8. Click Upload and Install.

You are now ready to proceed to detailed configuration.
BIG-IP SSL Orchestrator Configuration

In the sample topology demonstrated in Figure 6, the F5 system will be configured as an ICAP client to direct the decrypted web traffic, encapsulated in ICAP to the Trellix DLP service. The Trellix DLP service is defined as a pool of one or many Trellix DLP systems and will be configured as part of a service chain of security devices.

Figure 6: The Trellix DLP system in a BIG-IP SSL Orchestrator service chain architecture

USING GUIDED CONFIGURATION

The BIG-IP SSL Orchestrator guided configuration presents a completely new and streamlined user experience. This workflow-based architecture provides intuitive, reentrant configuration steps tailored to a selected topology.

The steps below will walk through the guided configuration to build a simple transparent forward proxy.

1. Once logged into the F5 system, in the F5 Web UI Main menu, click on SSL Orchestrator > Configuration.
2. Take a moment to review the various configuration options.

3. (Optional.) Satisfy any of the DNS, NTP, and Route prerequisites from this initial configuration page. Keep in mind, however, that the BIG-IP SSL Orchestrator guided configuration will provide an opportunity to define DNS and route settings later in the workflow. Only NTP is not addressed later.

4. No other configurations are required here, so click Next.

GUIDED CONFIGURATION WORKFLOW

The first stage of the guided configuration addresses topology.

Topology properties

1. BIG-IP SSL Orchestrator creates discreet configurations based on the selected topology. An explicit forward proxy topology will ultimately create an explicit proxy listener. Make appropriate selections in the Topology Properties section of the configuration, using the guidance below.

<table>
<thead>
<tr>
<th>Topology Properties</th>
<th>User Input</th>

</thead>
<tbody>
<tr>
<td>NAME</td>
<td>Enter a Name for the BIG-IP SSL Orchestrator deployment.</td>
</tr>
<tr>
<td>DESCRIPTION</td>
<td>Enter a Description for this BIG-IP SSL Orchestrator deployment.</td>
</tr>
</tbody>
</table>
### Topology Properties Cont.

<table>
<thead>
<tr>
<th>PROTOCOL</th>
<th>User Input Cont.</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>TCP:</strong> Creates a single TCP wildcard interception rule for the L3 Inbound, L3 Outbound, and L3 Explicit Proxy topologies.</td>
<td></td>
</tr>
<tr>
<td><strong>UDP:</strong> Creates a single UDP wildcard interception rule for L3 Inbound and L3 Outbound topologies.</td>
<td></td>
</tr>
<tr>
<td><strong>Other:</strong> Creates a single &quot;any protocol&quot; wildcard interception rule for L3 Inbound and L3 Outbound topologies. Typically used for non-TCP/UDP traffic flows.</td>
<td></td>
</tr>
<tr>
<td><strong>Any:</strong> Creates the TCP, UDP, and non-TCP/UDP interception rules for outbound traffic flows. Figure 7 and the sample configuration here demonstrates this option.</td>
<td></td>
</tr>
</tbody>
</table>

| IP FAMILY | Specify whether you want this configuration to support IPv4 addresses or IPv6 addresses. |

### BIG-IP SSL ORCHESTRATOR TOPOLOGIES

<table>
<thead>
<tr>
<th>BIG-IP SSL ORCHESTRATOR TOPOLOGIES</th>
<th>User Input Cont.</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>L3 explicit proxy:</strong> The traditional explicit forward proxy. The sample configuration presented here uses this topology.</td>
<td></td>
</tr>
<tr>
<td><strong>L3 outbound:</strong> The traditional transparent forward proxy.</td>
<td></td>
</tr>
<tr>
<td><strong>L3 inbound:</strong> A reverse proxy configuration.</td>
<td></td>
</tr>
<tr>
<td><strong>L2 inbound:</strong> Provides a transparent path for inbound traffic flows, inserting BIG-IP SSL Orchestrator as a bump-in-the-wire in an existing routed path, where BIG-IP SSL Orchestrator presents no IP addresses on its outer edges.</td>
<td></td>
</tr>
<tr>
<td><strong>L2 outbound:</strong> Provides a transparent path for outbound traffic flows, inserting BIG-IP SSL Orchestrator as a bump-in-the-wire in an existing routed path, where BIG-IP SSL Orchestrator presents no IP addresses on its outer edges.</td>
<td></td>
</tr>
<tr>
<td><strong>Existing application:</strong> Designed to work with existing F5® BIG-IP® Local Traffic Manager™ (LTM) applications that already perform their own SSL/TLS handling and client-server traffic management. The Existing Application workflow proceeds directly to service creation and security policy definition, then exits with a BIG-IP SSL Orchestrator-type access policy and per-request policy that can easily be consumed by a BIG-IP LTM virtual server.</td>
<td></td>
</tr>
</tbody>
</table>

The sample configuration presented here deploys BIG-IP SSL Orchestrator as an L3 explicit proxy for decrypting outbound SSL/TLS traffic. See Figure 9.
2. Click **Save & Next**.

**SSL configuration**
This section defines the specific SSL/TLS settings for the selected topology (a forward proxy in this example) and controls both client-side and server-side SSL/TLS options. If existing SSL/TLS settings are available from a previous workflow, they can be selected and reused. Otherwise, the **SSL Configuration** section creates new SSL/TLS settings.

1. Click **Show Advanced Settings** on the right-hand side of the page.
2. Make appropriate **SSL Configuration** selections using the guidance below.

<table>
<thead>
<tr>
<th>SSL Configurations</th>
<th>User Input</th>
</tr>
</thead>
<tbody>
<tr>
<td>SSL/TLS PROFILE</td>
<td></td>
</tr>
<tr>
<td>NAME</td>
<td>Enter a <strong>Name</strong> for the SSL/TLS profile.</td>
</tr>
<tr>
<td>DESCRIPTION</td>
<td>Enter a <strong>Description</strong> for this SSL/TLS profile.</td>
</tr>
<tr>
<td>CLIENT-SIDE SSL/TLS</td>
<td></td>
</tr>
<tr>
<td>CIPHER TYPE</td>
<td>Cipher type can be a Cipher Group or Cipher String.</td>
</tr>
<tr>
<td></td>
<td>• For <strong>Cipher Group</strong>, select a previously defined cipher group (which can be defined if necessary, by navigating to <strong>Local Traffic &gt; Ciphers &gt; Groups</strong>).</td>
</tr>
<tr>
<td></td>
<td>• When <strong>Cipher String</strong> is selected, a field will be populated with the DEFAULT option, which is optimal for most environments. (Otherwise, users could also enter a cipher string that appropriately represents the client-side SSL/TLS requirement.)</td>
</tr>
</tbody>
</table>
The certificate key chain represents the certificate and private key used as the template for forged server certificates. While reissuing server certificates on the fly is generally easy, private key creation tends to be a CPU-intensive operation. For that reason, the underlying SSL/TLS forward proxy engine forges server certificates from a single defined private key. This setting gives administrators the opportunity to apply their own template private key and to optionally store that key in a FIPS-certified HSM for additional protection. The built-in default certificate and private key uses 2K RSA and is generated from scratch when the F5 system is installed.

Select the default.crt certificate, default.key key, and default.crt chain. Leave the Passphrase field empty and click Add.

An SSL/TLS forward proxy must re-sign or forge remote server certificate to local clients using a local CA certificate, and local clients must trust this local CA. This setting defines the local CA certificate and private key used to perform the forging operation.

Specify one or more configured subordinate CA certificates and keys that were imported earlier, then click Add.

Select Cipher String for the default cipher list.

Use the ca-bundle.crt file, which contains all well-known public CA certificates, for client-side processing.

3. Click Save & Next.

Note: SSL/TLS settings minimally require an RSA-based template and CA certificates but can also support elliptic curve (ECDSA) certificates. In this case, BIG-IP SSL Orchestrator would forge an elliptic curve (EC) certificate to the client if the SSL/TLS handshake negotiated an ECDHE_ECDSA cipher. To enable EC forging support, add both an EC template certificate and key, and an EC CA certificate and key.
Create the Trellix DLP ICAP service

The guided configuration includes a services catalog that contains common product integrations. Beneath each of these catalog options is one of the five basic service types: Layer 3, layer 2, ICAP, TAP, and HTTP service.

To configure the service:

1. Under Service List, click Add Service.

2. In the service catalog, double click on the Trellix DLP ICAP service tile.

3. The Service Properties page displays. Configure the service using the guidance below.

<table>
<thead>
<tr>
<th>Service Properties</th>
<th>User Input</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>SERVICE SETTINGS</strong></td>
<td></td>
</tr>
<tr>
<td>NAME</td>
<td>Enter a Name for the Trellix DLP ICAP service. This name can contain 1-15 alphanumeric or underscore characters but must start with a letter. Letters are not case sensitive.</td>
</tr>
<tr>
<td>DESCRIPTION</td>
<td>Enter a Description for the Trellix DLP ICAP service.</td>
</tr>
<tr>
<td>ICAP DEVICES</td>
<td>Click Add and enter the IP address and port number of the Trellix DLP system. Make sure that the default ICAP port number is 1344. Click Add</td>
</tr>
<tr>
<td>Service Properties Cont.</td>
<td>User Input Cont.</td>
</tr>
<tr>
<td>-------------------------</td>
<td>-----------------</td>
</tr>
<tr>
<td>ICAP HEADERS</td>
<td>Select <strong>Default</strong> to send the default request-specific headers allowed in ICAP requests. Otherwise, select <strong>Custom</strong> to edit the following header values:</td>
</tr>
<tr>
<td></td>
<td>• <strong>Host</strong>: Specifies the Internet host and port number of the requested resource, as obtained from the original URI given by the user or referring resource.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Referrer</strong>: Allows BIG-IP SSL Orchestrator, as the ICAP client, to specify (for the ICAP server) the address (URI) of the resource from which the Request-URI was obtained.</td>
</tr>
<tr>
<td></td>
<td>• <strong>User Agent</strong>: The client that initiates a request, often browsers, editors or other user tools.</td>
</tr>
<tr>
<td></td>
<td>• <strong>From</strong>: Contains the email address of the user who controls the requesting user agent.</td>
</tr>
<tr>
<td>ONE CONNECT</td>
<td>Select <strong>One Connect</strong> to reuse the TCP connections to ICAP servers, which process multiple transactions.</td>
</tr>
<tr>
<td>REQUEST</td>
<td>Leave the default ICAP request URI as defined by RFC3507. icap://${SERVER_IP}:${SERVER_PORT}/req</td>
</tr>
<tr>
<td>RESPONSE</td>
<td>Leave the default ICAP response URI as defined by RFC3507. icap://${SERVER_IP}:${SERVER_PORT}/res</td>
</tr>
<tr>
<td>PREVIEW MAX. LENGTH (BYTES)</td>
<td>The number of bytes sent to the ICAP server as a preview of each HTTP request or response. The recommended preview length for Trellix DLP system is 1024 bytes.</td>
</tr>
<tr>
<td>SERVICE DOWN ACTION</td>
<td>Select <strong>Ignore</strong> for the system to allow the request or response to continue to the next service in the service chain. Or select <strong>Reset Connection</strong> if you want the system to reset the connection to the client, discarding the request and response.</td>
</tr>
<tr>
<td>HTTP VERSION</td>
<td>Select to send both HTTP/1.0 &amp; HTTP/1.1 requests to the ICAP service.</td>
</tr>
<tr>
<td>ICAP POLICY</td>
<td>If you want to associate a BIG-IP LTM policy (for example: Disable ADAPT request/response based on HTTP req/rep properties) to the ICAP service, select the policy here.</td>
</tr>
</tbody>
</table>

4. Click **Save** to return to the Service List. Click **Add Service** to access the service catalog again for creating additional services.

5. Once all the desired services are created, click **Save & Next** to move on to service chain setup.
Configuring service chains

Service chains are arbitrarily ordered lists of security devices. Based on the ecosystem’s requirements, different service chains may contain different, reused sets of services, and different types of traffic can be assigned to different service chains. For example, HTTP traffic may need to go through all of the security services while non-HTTP traffic goes through a subset of those services and traffic destined to a financial service URL can bypass decryption and still flow through a smaller set of security services.
Each service chain is linked to service chain classifier rules and processes specific connections based on those rules, which look at protocol, source, and destination addresses. Service chains can include each of the three types of services (inline, ICAP, or receive-only), as well as decryption zones between separate ingress and egress devices.

To create a service chain:

1. Under Services List, click Add Service. Make selections using this guidance below.

<table>
<thead>
<tr>
<th>Service Chain Properties</th>
<th>User Input</th>
</tr>
</thead>
<tbody>
<tr>
<td>NAME</td>
<td>Enter a Name for the per-request service chain.</td>
</tr>
<tr>
<td>DESCRIPTION</td>
<td>Provide a Description for this service chain.</td>
</tr>
<tr>
<td>SERVICES</td>
<td>Select the Trellix DLP ICAP service and any other desired services from the Services Available list and move them into the Selected Service Chain Order column. Optionally, order them as desired.</td>
</tr>
</tbody>
</table>

2. Click Save & Next.
Security policy
Security policies are the set of rules that govern how traffic is processed in BIG-IP SSL Orchestrator. The actions a rule can require include:

- Whether or not to allow the traffic indicated in the rule.
- Whether or not to decrypt that traffic.
- Which service chain (if any) to pass the traffic through.

BIG-IP SSL Orchestrator’s guided configuration presents an intuitive rule-based, drag-and-drop user interface for the definition of security policies. In the background, BIG-IP SSL Orchestrator maintains these security policies as visual per-request policies. If traffic processing is required that exceeds the capabilities of the rule-based user interface, the underlying per-request policy can be managed directly.

1. To create a rule, click **Add**.
2. Create a security rule as required.
3. Click **Add** again to create more rules or click **Save & Next**.

Interception rules
Interception rules are based on the selected topology and define the listeners (analogous to BIG-IP LTM virtual servers) that accept and process different types of traffic, such as TCP, UDP, or other. The resulting BIG-IP LTM virtual servers will bind the SSL/TLS settings, VLANs, IPs, and security policies created in the topology workflow.

1. To create an interception rule, follow this guidance:
2. Click **Save & Next**.
Egress setting

The **Egress Setting** page defines the topology-specific egress characteristics.

1. To configure these characteristics, follow this guidance:

<table>
<thead>
<tr>
<th>Intercept Rule</th>
<th>User Input</th>
</tr>
</thead>
<tbody>
<tr>
<td>LABEL</td>
<td>Enter a <strong>Name</strong> for the label.</td>
</tr>
<tr>
<td>DESCRIPTION</td>
<td>Enter a <strong>Description</strong> for this rule.</td>
</tr>
<tr>
<td>PROXY SERVER SETTINGS</td>
<td>This setting, which displays when configuring an explicit proxy, defines the BIG-IP SSL Orchestrator explicit proxy listening IP address and proxy port. For explicit proxy authentication, this section also allows for the selection of a BIG-IP APM SWG-explicit access policy.</td>
</tr>
<tr>
<td>IPV4 ADDRESS</td>
<td>Specify the explicit proxy listening IP address.</td>
</tr>
<tr>
<td>PORT</td>
<td>Specify the port number.</td>
</tr>
<tr>
<td>INGRESS NETWORK</td>
<td>This defines the VLANs through which traffic will enter. For a forward proxy topology (outbound), for instance, this would be the client-side VLAN (Intranet).</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Egress Settings</th>
<th>User Input</th>
</tr>
</thead>
<tbody>
<tr>
<td>MANAGE SNAT SETTINGS</td>
<td>Defines if and how source NAT (SNAT) is used for egress traffic.</td>
</tr>
<tr>
<td>GATEWAYS</td>
<td>Enter the IP address of next hop route for traffic. For an outbound configuration, this is usually a next hop upstream router.</td>
</tr>
</tbody>
</table>

2. Click **Save & Next**.

Configuration summary and deployment

The configuration summary presents an expandable list of all of the workflow-configured objects.

1. To review the details for any given setting, click the corresponding arrow icon on the far right.

2. To edit any given setting, click the corresponding pencil icon. Clicking the pencil icon will display the selected settings page in the workflow.
3. When you are satisfied with the defined settings, click **Deploy**. Upon successful deployment of the configuration, BIG-IP SSL Orchestrator will display a dashboard. See Figure 21.

![Figure 21: The configuration dashboard after deployment](image)

This completes configuration of BIG-IP SSL Orchestrator as a forward proxy. At this point an internal client should be able to browse to external (Internet) resources, and decrypted traffic will flow across the security services.

**Testing the Solution**

Test the deployed solution using any one of the following three options:

**SERVER CERTIFICATE TEST**

Open the browser on the client system and navigate to a HTTPS site, for example, [https://www.Trellix.com](https://www.Trellix.com). Once the web page loads, check the server certificate by clicking the padlock on the address bar. Verify that the certificate has been issued by the local CA set up on the F5 system. This confirms that the SSL/TLS forward proxy has intercepted the web request and reassigned the response from the web server, validating that the functionality enabled by BIG-IP SSL Orchestrator is working as expected.

**DECrypted Traffic Analysis**

Perform a TCP dump from the F5 system command line interface to observe the decrypted clear text HTTP headers and payload. This confirms SSL/TLS interception by BIG-IP SSL Orchestrator.

```
tcpdump -l -n -i eth<n> -Xs0
```
TRELLIX DLP POLICY RULE VIOLATION

On a client device:

1. Open browser and navigate to https://dlptest.com (DLPTest.com is a DLP testing resource that focuses on testing to make sure your DLP software is working correctly).

2. Click on the HTTPS Post tab. In the text box, input some PII data (an example of PII data is ‘ABC Smith, 123-45-6789, 123 Main St, Seattle WA 98008’). Click on the Submit button.

3. You will see the ‘Access Denied’ message in the response.

4. Open Trellix ePO web UI. From the main menu, navigate to Data Protection > DLP Incident Manager. The DLP Incident Manager web page reports the PII violation.

Figure 22: DLP Incident Manager
