Introducing BIG-IP Next Access

The next generation of access control, BIG-IP Next Access, is designed to deliver application access as code. With BIG-IP Next Access, you can shift access left, reducing your operational complexity and costs by deferring authentication and authorization to an API-centric, hardened access security solution.
Introducing BIG-IP Next Access

Apps Are Changing—So Is the Way We Access and Secure Them

Applications, the environments in which they’re deployed, and the measures needed to secure access to them are evolving at a record pace. Look no further than today’s modern businesses to see this transformation in action. These businesses are increasingly automated, relying on models like DevSecOps to deliver greater code quality, faster time to market, and security oversight. In the typical application portfolio, there is now a mix of modern, legacy, SaaS-based, and custom applications. Similarly, the platforms that support these apps are becoming increasingly hybrid as well, from on-premises data centers and private clouds to multiple public clouds and remote edge locations. This hybrid infrastructure enables greater control, resource optimization, and an enhanced user experience. Moreover, users, including billions of mobile and remote workers globally, are able to carry out their work tasks from anywhere, using a combination of personal and corporate devices.

While these trends pave the way for greater business innovation and adaptability, they also fundamentally change the requirements for securing access to today’s applications. Identity and access have become core to app security with a zero trust application access model as the gold standard approach. Businesses need to bridge the gap between applications that use both legacy and modern authentication protocols. Additionally, they must enable single sign-on (SSO) and multi-factor authentication (MFA) for every application to ensure access is least-privileged, context- and identity-based. This approach also removes the complexity associated with managing multiple points of control for authentication and authorization. Equally important, businesses need to reduce the overhead and complexity associated with security architecture itself. To support an increasingly automated and DevSecOps-driven business environment, application access security needs to be automated and agile—from the policies through to the underlying software platform.

KEY BENEFITS

Accelerate Time-to-Market
Get greater agility with an API-first, app-centric access security architecture.

Reduce Security Risk
Move authentication to a hardened access security solution.

Deploy Fast, Consistent Policy Updates
Write an access policy once, deploy it to multiple instances and freely migrate policies across platforms.

Support a Zero Trust Operational Model
Ensure context-and-identity based per-request app access for every app—all from a single point of control.

Make Rapid or Partial Upgrades
Introduce new access security features with significantly less downtime.
Introducing the F5 BIG-IP Next Platform for Greater Agility and Access Security

F5 BIG-IP® Next™ is the next-generation of F5’s BIG-IP software. Leveraging a modern, highly scalable, automatable software architecture, you can capitalize on all the innovation happening with applications and the cloud while solving for the security challenges that come with hybrid apps and platforms.

Architected as a modernized software framework, BIG-IP Next accelerates application delivery with app services that can be deployed wherever they’re needed. These services are supported by programmatic interfaces that are both declarative and backward compatible.

The declarative APIs (AS3) and configuration templates (FAST) are designed for reusability, enabling comprehensive instance control and accelerating the app provisioning process. This results in a significant reduction in provision time, from hours to minutes.

This lightweight and adaptable architecture not only simplifies operations and drives down costs but also delivers the flexibility and scale necessary to support the most configuration-intensive applications.

BIG-IP Next Central Manager Delivers Centralized Control and Visibility Across All Your BIG-IP Next Instances

At the core of every BIG-IP module is F5 BIG-IP® Next™ Central Manager, an intuitive user interface that reduces the complexity and time needed to perform critical tasks and workloads. BIG-IP Next Central Manager provides a single source of truth, ensuring consistency and enforcing compliance. Now, you can more cost effectively manage all your BIG-IP instances with:

- Full instance lifecycle management
- Policy, compliance management, and security enforcement
- GUI, CLI, and API driven service provisioning and troubleshooting
- Detailed visibility and analytics
- Automation leveraging Application Services Extension (AS3) and F5 Application Services Template (FAST)
BIG-IP Next Access Delivers API-First, App-Centric Access Security

F5 BIG-IP® Next™ Access is the next-generation of BIG-IP access control, enabling greater automation, scale, and overall ease of use. Designed to deliver application access as code, BIG-IP Next Access allows you to shift access left and reduce your operational complexity and cost by deferring authentication and authorization to a hardened access security solution.

No matter what authentication protocol your apps use, BIG-IP Next Access allows you to bring modern authentication and authorization, in addition to enabling SSO and MFA, to every application in your portfolio simply by writing to an API or embedding APIs directly within your application development CI/CD pipeline.

With a completely rearchitected software layer leveraging a modern, container-based framework, you can migrate access policies across platforms* while also gaining significantly improved control plane scale. This means you can allocate dedicated compute resources to support the control plane as demands change and update configurations in real-time to prevent overload and maintain performance. You can also accelerate the upgrade and update process by selecting just the modules that require changes.

As a result, you can focus on what is imperative to your applications—building features—while ensuring your security measures are tested and the necessary context- and identity-based policies and zero trust operational model are extended across your entire application portfolio.

Seamlessly Migrate Existing BIG-IP Configurations to BIG-IP Next

Converting existing BIG-IP configurations into ones that are compatible with BIG-IP Next, the F5 Journeys Migration Tool drastically reduces the time and effort required to transition to F5’s next-generation software. Utilizing Application Services 3 Extension (AS3) as the foundation for this process, the tool transforms BIG-IP TMOS User Configuration Set (UCS) files or AS3 declarations into configurations compatible with BIG-IP Next. This process can be performed for entire BIG-IP instances or on a per-app basis, allowing you to set the migration pace and ultimately have greater control.

*F5 BIG-IP® Virtual Edition (VE), F5 rSeries, and F5 VELOS® platforms
Flexible Deployment and Licensing Options

BIG-IP Next Access is supported across a range of deployment options to satisfy the requirements of any application deployment—from cloud to edge and on-premises:

- **VELOS**: Powerful next-generation chassis system
- **rSeries**: API-first appliance for traditional and emerging apps
- **Virtual Edition**: Cloud-optimized virtual instance for public or private cloud

Choose the licensing model that best suits your needs, including perpetual, subscription, utility, or the flexible consumption program:

- **Subscription**: Renewable 1- to 3-year subscriptions affording initial upfront savings plus access to F5 premium support included
- **Flexible consumption program**: 3-year enterprise agreement empowering self-service licensing for maximum architectural flexibility
- **Utility**: Pay-as-you-go model with no long-term commitments plus access to F5 premium support
- **Perpetual**: One-time CapEx investment providing complete solution ownership
