Use of mobile devices for financial services is exploding across the banking, trading, and insurance markets. Organizations must scale their IT infrastructures to match demand while ensuring reliable service, protecting personal and corporate information, and maintaining regulatory compliance.

Responding to Exponential Growth

Globally, 114 billion mobile banking transactions occurred in 2012¹ and demand will only increase. Customers want access to their money and information about accounts, transactions, and claims on the go, in real time, and they won’t tolerate delays. To stay ahead of the competition, financial services institutions must offer customers secure access across the spectrum of devices in an environment where milliseconds count.

Yet rapid growth has already overburdened many IT infrastructures, and attackers are constantly maneuvering to steal personally identifiable information or damage corporate reputations. F5 solutions help companies successfully navigate all of these challenges. The F5® BIG-IP® platform enables growth with a single, highly scalable platform that speeds performance, increases uptime, and delivers unified access control to enhance security, ensure compliance, and reduce costs.

The F5 Solution to Mobile Banking

F5 recognizes and tailors solutions to customers who demand secure, responsive, and accurate mobile access to their financial services. Through BIG-IP® Access Policy Manager® (APM), financial organizations can securely manage identity, as well as deliver the optimum experience to their customers based on their specific mobile device. F5 solutions go one step further with customer segmentation, ensuring VIP clients have access to the resources and support critical to their business needs.

When using mobile apps, fast response times contribute to the highest level of customer satisfaction, and BIG-IP® WebAccelerator™ provides a suite of optimizations focused on speed and efficiency. F5 TCP Express™ and device targeted caching offer fast upload and download times, all while requiring low bandwidth thanks to TCP connection multiplexing in F5 OneConnect™.

Continuous, consistent access through mobile devices is now the industry standard, and F5 delivers with BIG-IP Global Traffic Manager™ (GTM). Financial organizations can balance server load and provide high performance and tight security at any time of day, even amid constantly increasing traffic and bursts in demand.

Most importantly, customers insist on security and trust financial organizations to safeguard their personal and financial data. F5 delivers security innovation with BIG-IP® Application Security Manager™ (ASM) and F5 iControl®, which work together to keep customer data safe in the event of an attack. Customers enjoy uninterrupted service through integrated identity management and external detection systems.

The F5 security and services layer identifies context by looking at data in the transaction, or by extracting data from external services.
